AI Potential in Manufacturing

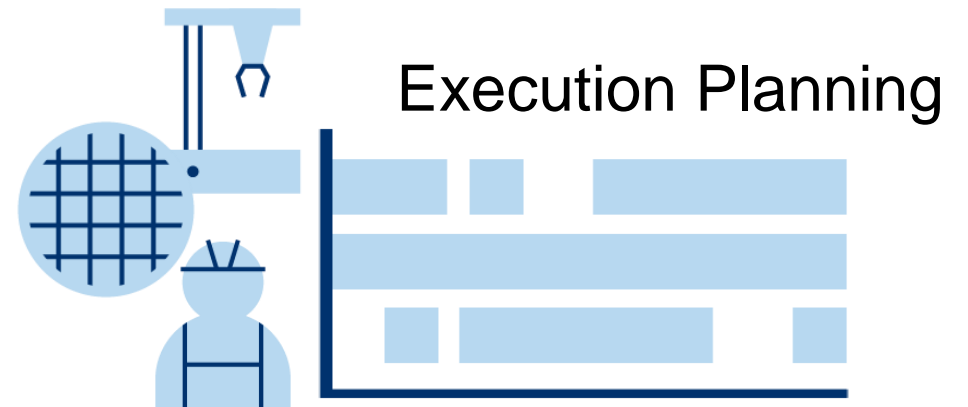

Predictive Maintenance

Predictive Quality

Factory Health & Anomaly Detection

Execution Planning

Challenges of AI in Manufacturing

- Search space complexity
- Problem formulation
- Non-rectangular data
- Lack of training data
- Often no steady state
- Product mix leads to many models
- Many shopfloor unicorns
- AI ownership and model maintenance
- Unclear return on investment

Autonomous Integrated Scheduling for Semiconductor Industry

Project Lead
BOSCH

Countries
2

Partners
6

Costs
>3.4 Mio. €

Research Area
Smart Industry

Duration
36 Months

<https://aissi-project.com>

Expected Improvements

Simulated area throughput
15% increase

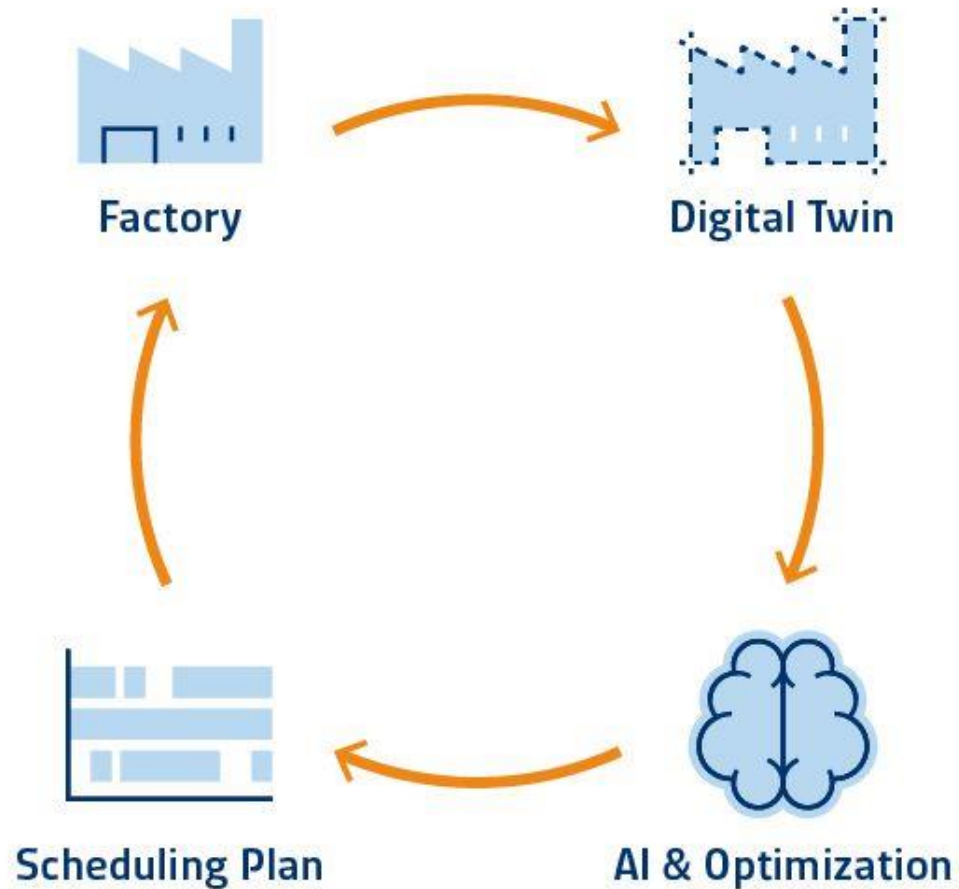

Simulated area WIP level
10% decrease

Compliance to scheduling results
10-20% increase

Cycle Time variability
15% decrease

Equipment utilization
1-2% increase

Enable Reinforcement Learning for Shopfloor Execution Planning

Epitaxy Production at Nexperia Hamburg

- Optimize throughput and other objectives in the epitaxy area at Nexperia Hamburg
- Initial process step for majority of flow definitions
- Epi is a rate-limiting process step
- Establish analytical model to quantify production improvements and ROI
- Improvements could be better execution planning but also other types of process changes

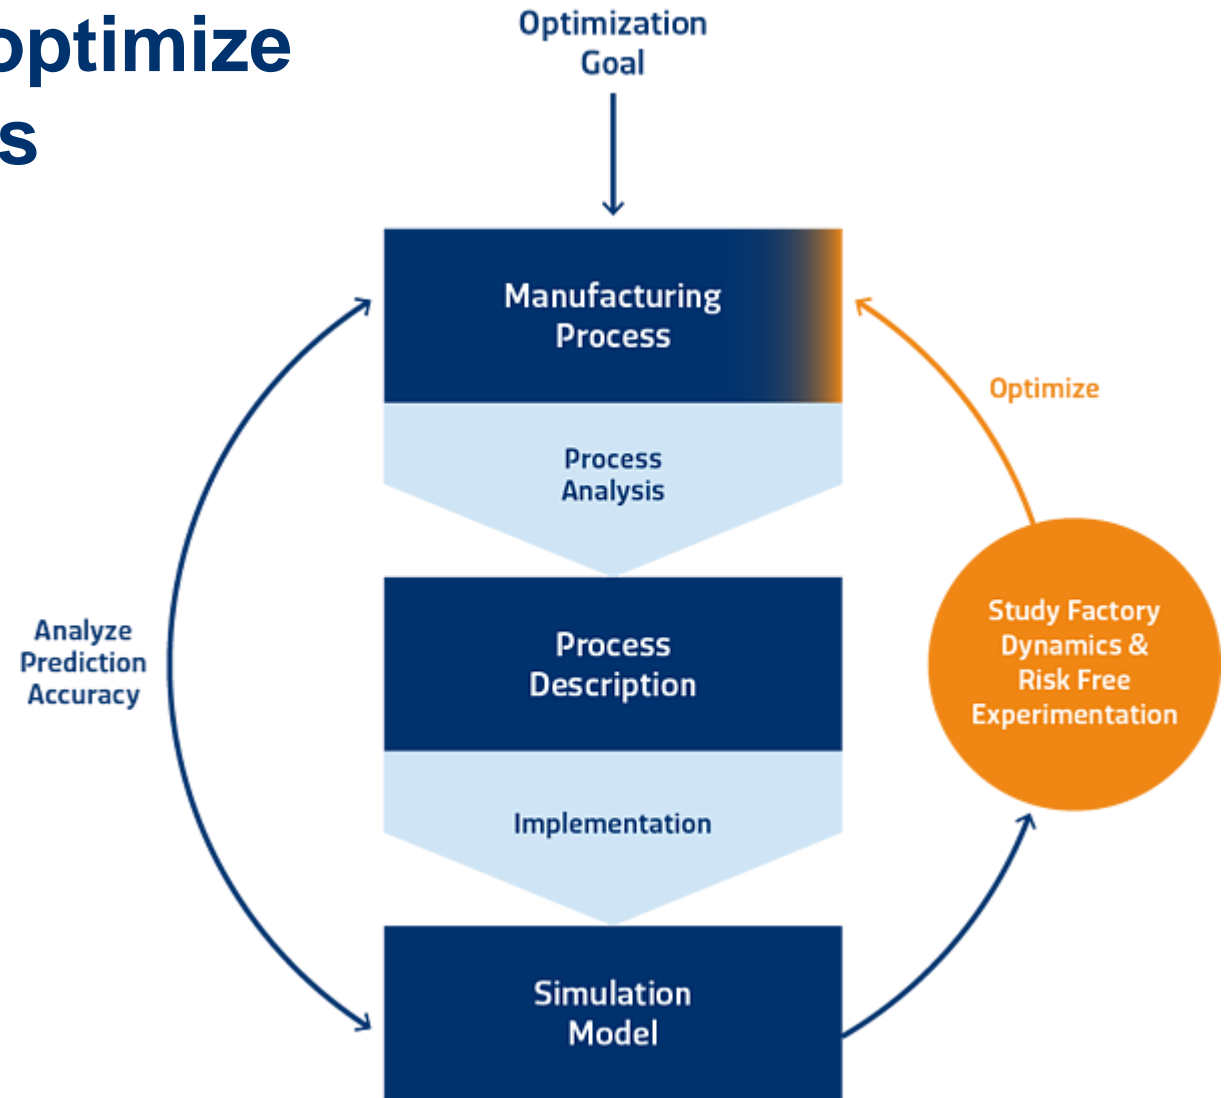

nexperia

EFFICIENCY WINS.

<https://www.nexperia.com/about.html>

Use model-based analysis to optimize complex production processes

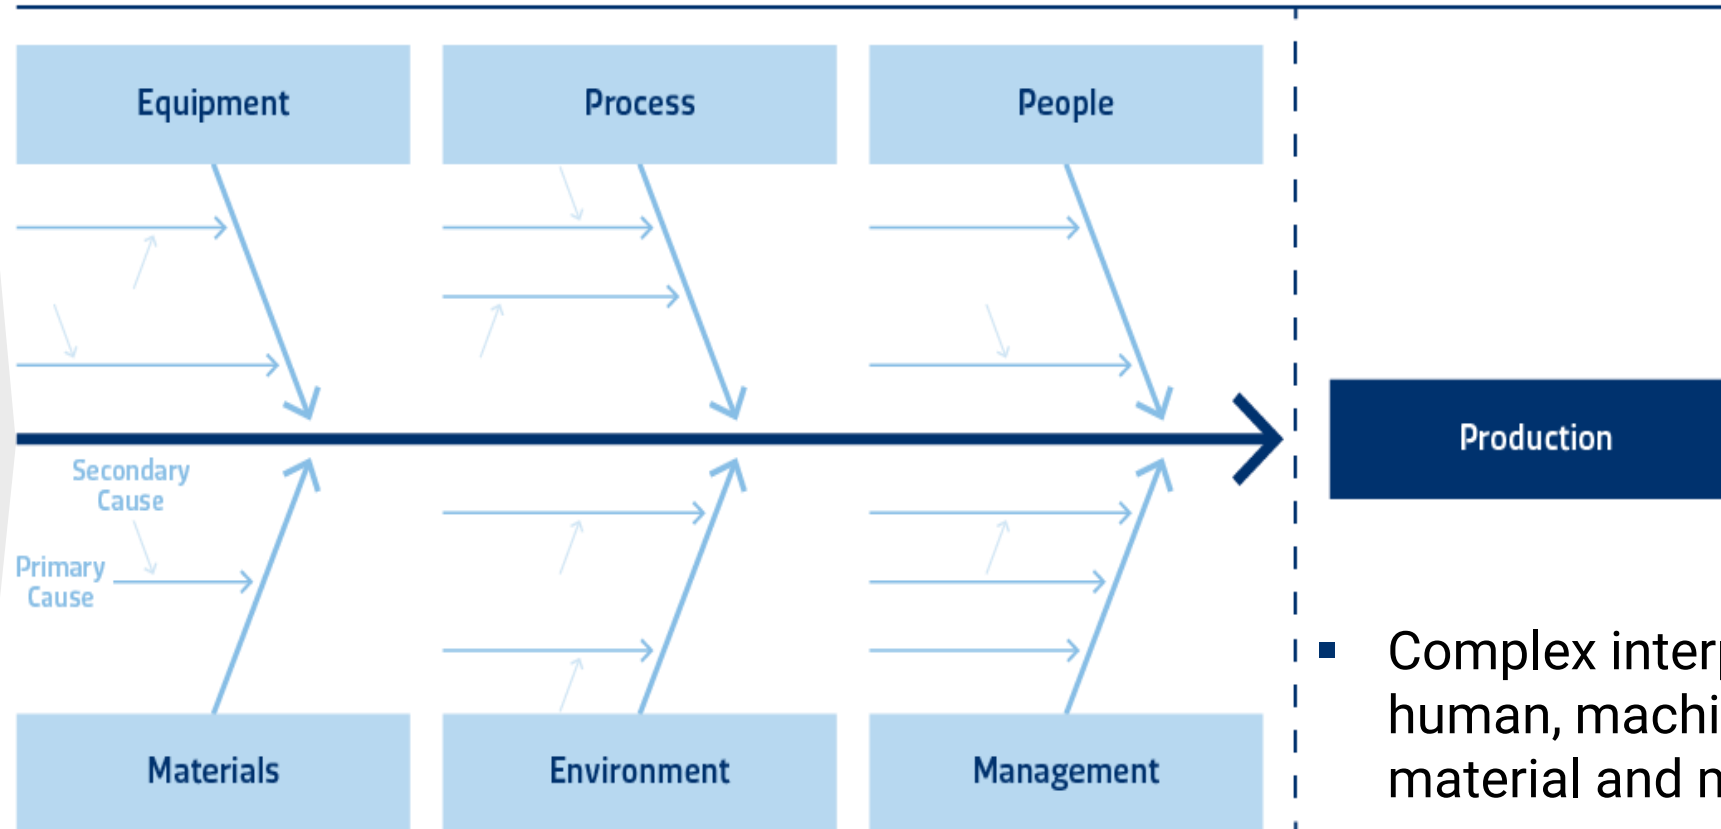

Study & Quantify changes to production execution using process simulation & modelling

Semiconductor Front End Operations

CAUSE

EFFECT

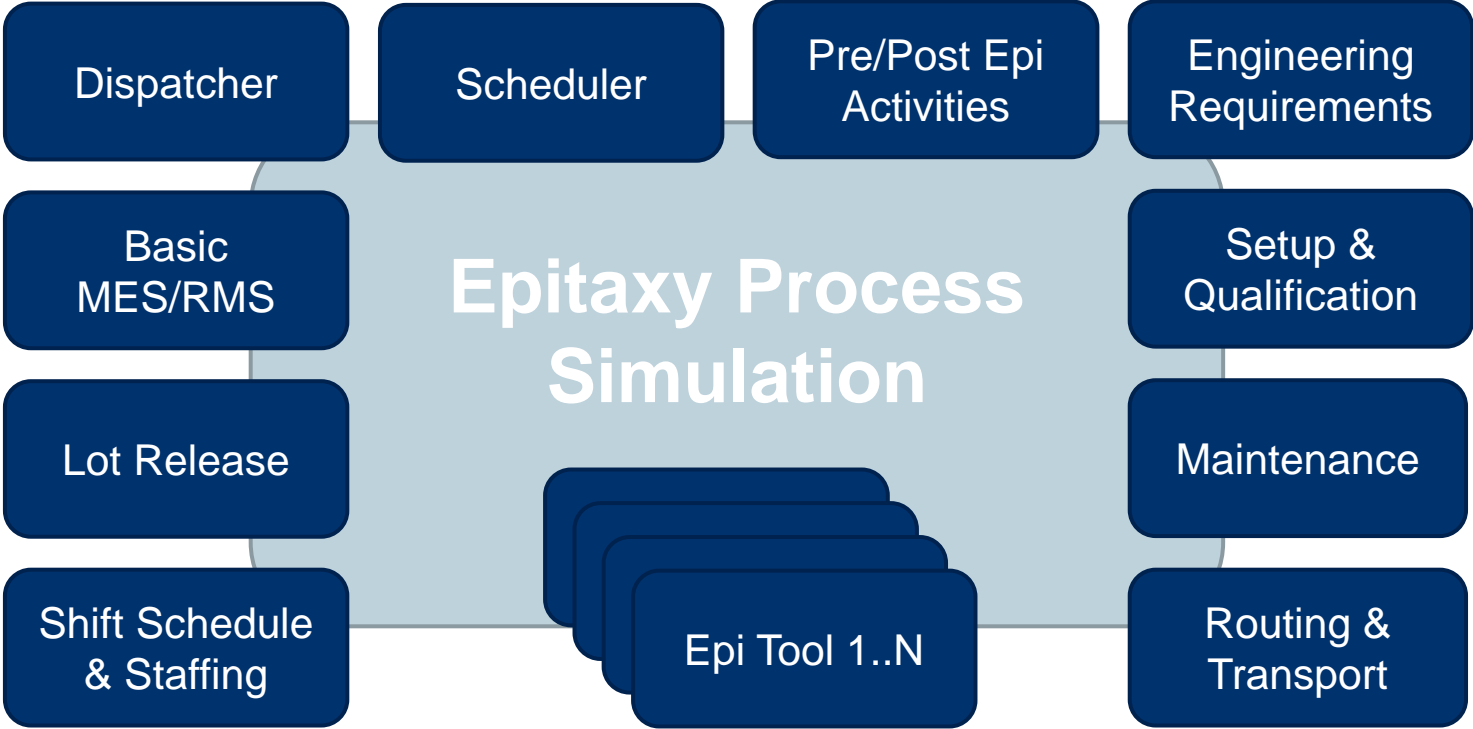

- Complex interplay of human, machine, material and methods
- Not always following intuition

Material Types
 Hold Status
 Material Ownership
 Cycle Times
 Due Dates
 Equipment Capabilities
 Anticipated Downtimes
 Equipment State
 Dummy/Baffle Filler Material
 Tests/Experiment Conditions
 Date/Time Calculations
 Downstream Resource State
 Up/Downstream Inventory
 Timer Expirations
 Critical Ratios
 Kanban
 Raw Material States
 Recipes
 Process Times
 ...

Simulation Model
Epitaxy Area Hamburg

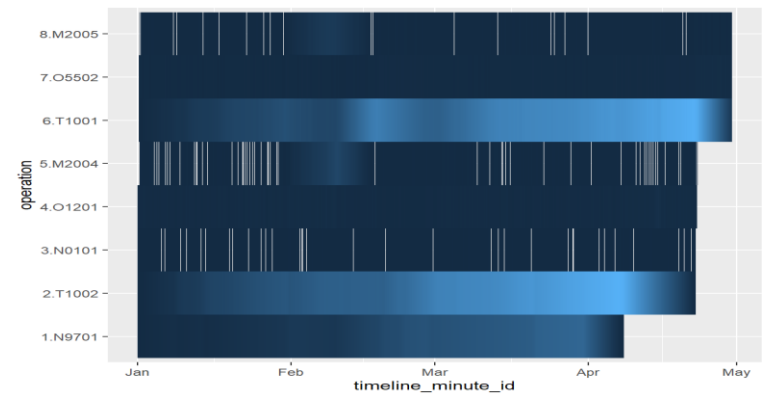

Epitaxy Process Simulation

- Parametrized using various data snapshots from MES, ERP & shopfloor

SYSTEMA Semiconductor Frontend Simulation Toolbox

- Discrete-event Frontend fab simulation model
- Realistic flows (cyclic routes, split/merge, rework, scrap)
- Lot & Tool granularity (with options for abstraction)
- Qualification (Stochastic, Rule-Based, Expiration)
- Tool properties (rates, load ports, batching)
- Flexible statistic and rule-based lot release
- Tool down, maintenance, personnel
- “Warm start” using material & tool state data
- Fast: simulate **years** of production in **just seconds**

Epitaxy Process Simulation: Tool State & Setup

Area throughput limited by multiple resources (lot provisioning, operators, tools, maintenance)

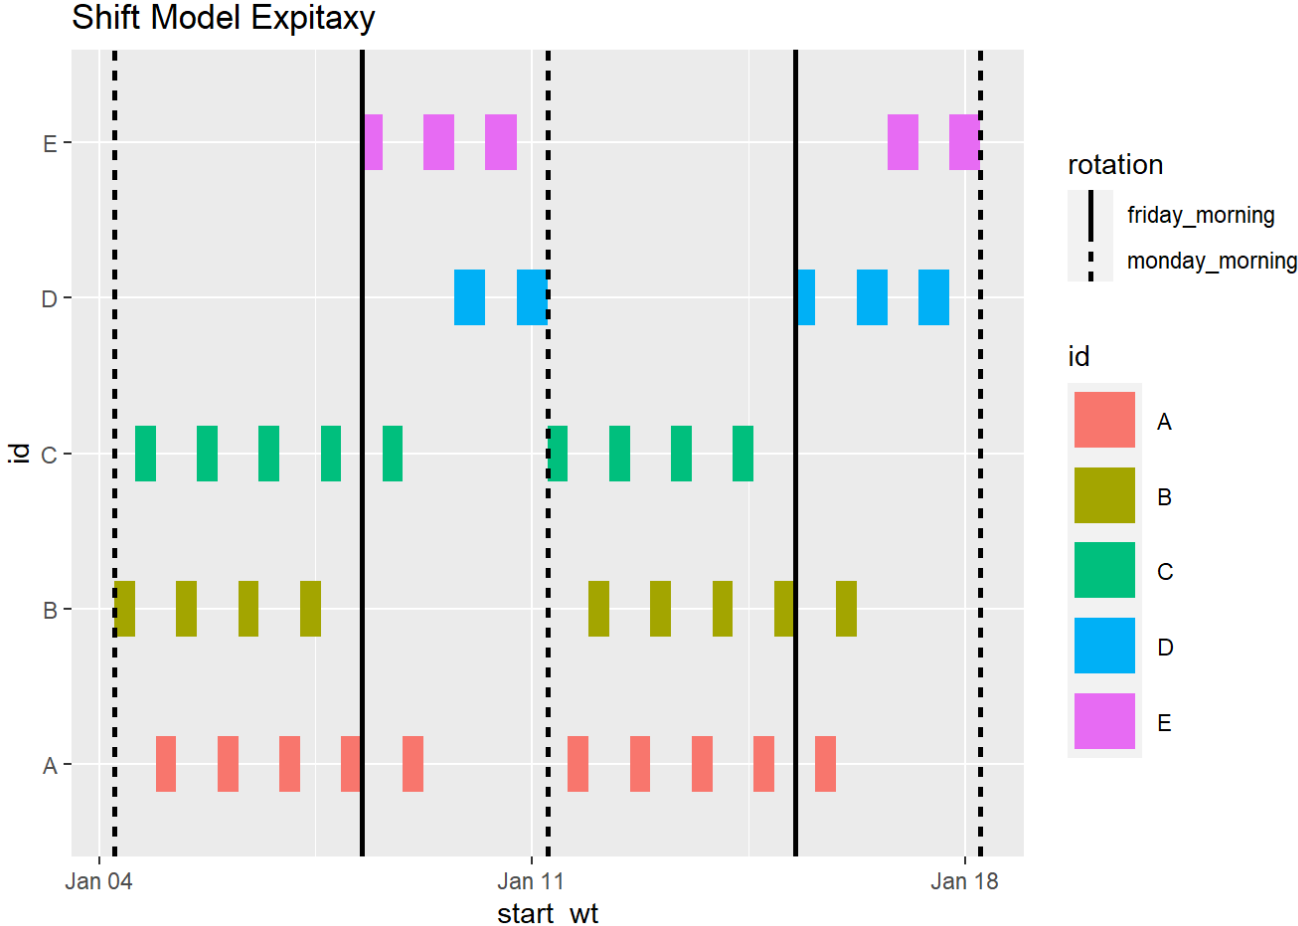

Maintenance Planning

- Maintenance tasks are defined in external ERP system
- Tools loose qual if maintenance does not happen within defined time window

Put operators into the center and not machines

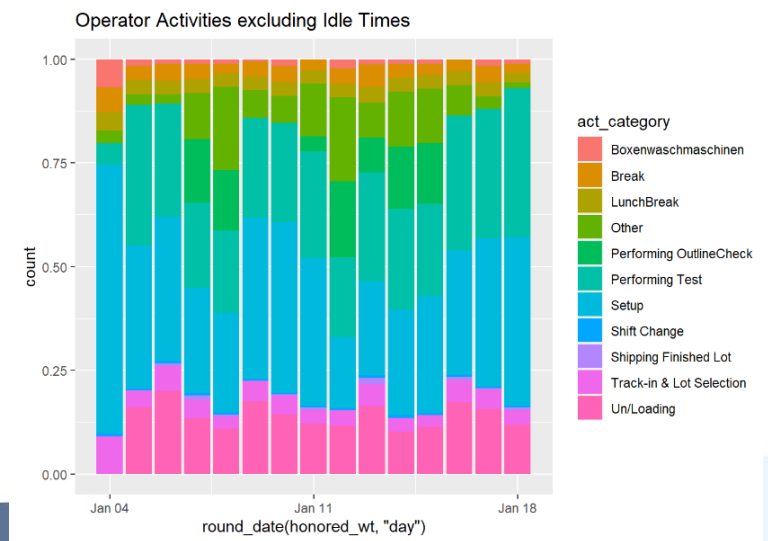

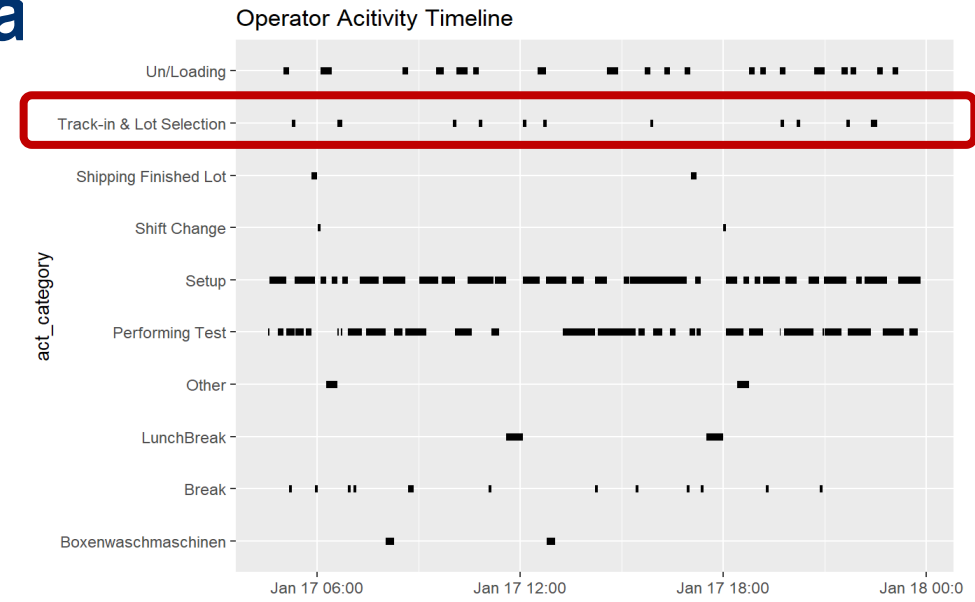

- Operators need to hand over area to next shift
- During shift-handover, new lots won't be started since operators are busy

Model-Driven Production Optimization

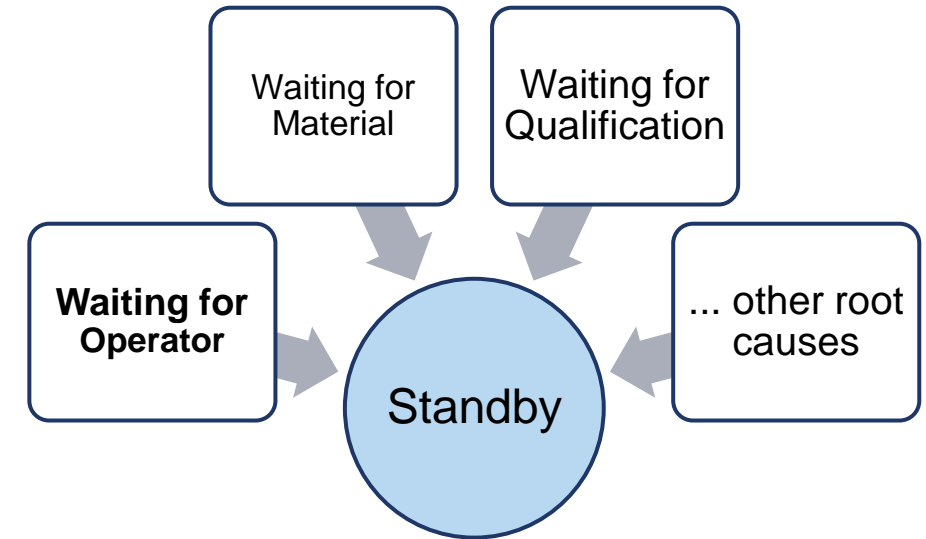

Operator Workload in Epitaxy Area

- Understaffed area: waiting for qual and operators are a major productivity constraint
- Detailed area model including operator activities
- ~5min spent to select next lot and to track it into MES
- What if we could streamline the operator guidance process to save just these five minutes?

Optimize Bottleneck Tool Groups by Reducing Standby

- "Standby" status very present in all reference tool groups
- Multifactorial problem
- How much throughput could be gained with a simpler operator interface?
 - Fewer degrees of freedom
 - Less information

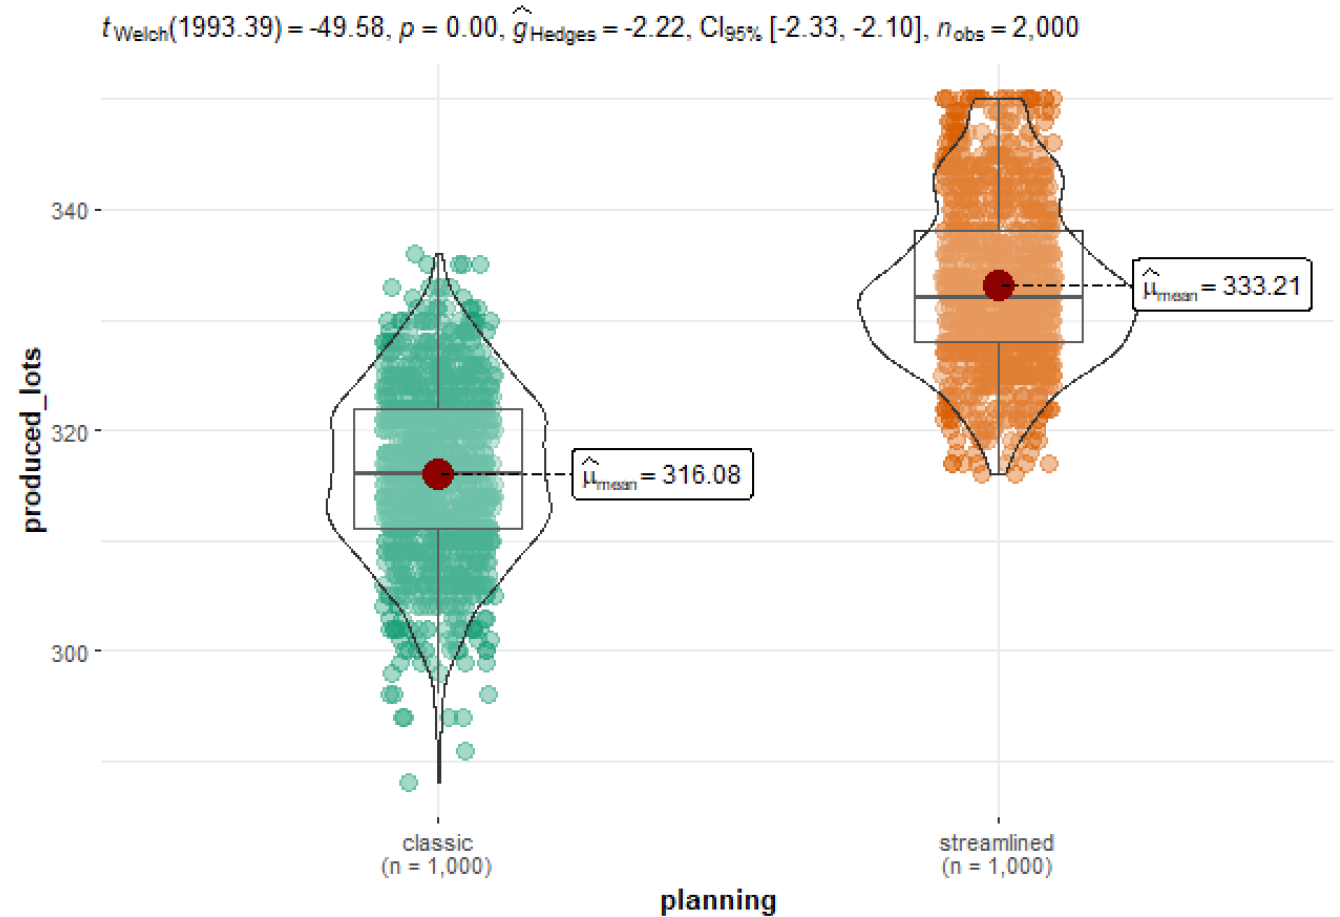

Improved Operator Guidance and Interface → +5% Throughput

Considered two simulation scenarios

- *Classic* – it takes 5 mins to select and track-in a lot
- *Streamlined* – it takes a negligible time to do so

- 14 days (with repetition)
- Significant productivity boost from better operator guidance
- Improved productivity in bottleneck areas

SYSTEMA Shopfloor Scheduler

- AI constraint solver
- Based on lightweight, embeddable planning engine
- Extensions for 4M semi-production optimization (Staffing, Material, Routes)
- Over-constrained planning
- Continuous, event-driven planning
- Planning entity pinning
- Multi-stage planning

Bin Packing & Batch Formation

Job Shop Scheduling

Material Routing

Shopfloor Scheduler

Operator & Engineering Scheduling

Equipment Scheduling

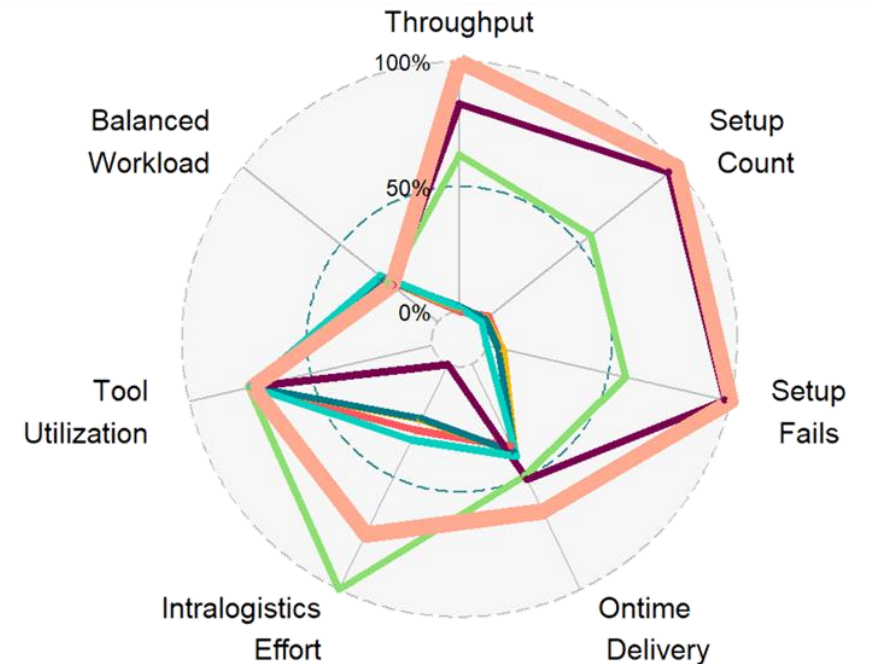

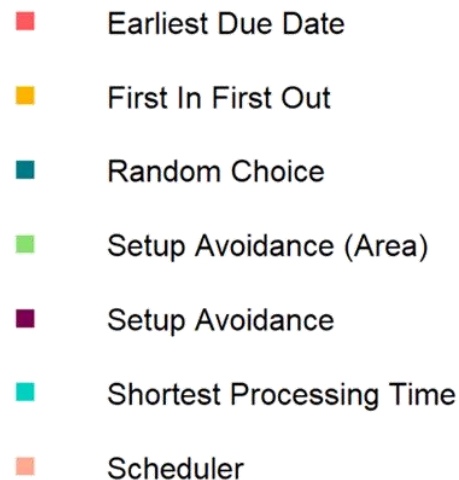

Optimization Goals: Epitaxy Process @ NEXPERIA

- **Task Assignment Uniformity:** Maximize and level tool utilization within tool group
 - **Minimize Set Up:** Consider tool setup state when building schedule
 - **Shift Hand Over Overlap:** Tasks should not start during a shift handover period
 - **Minimize Cycle Time:** Schedule tasks as early as possible
 - **Ensure Due Date Compliance:** Make sure lots are finished before their due date
 - **Minimize Material Transport:** Consider shelf-location when scheduling lots to tools
- Balance conflicting production targets
- Complex cost function with constraints

Planning Method Performance Analysis

- Scheduler outperforms baseline dispatching rules with respect to all key metrics
- Maximization & Balancing of production targets via integrated cost function
- Configurable by user
- Continuous benchmarking using current product data

First Results: Reinforcement Learning Planning Agent

- Only assessed very small WIP configuration
- Poor generalization
- Not all optimization requirements of Nexperia could be modelled with the RL agent

Ongoing Research with AISSI Partners

- Suitable problem formulation
- MCTS compute requirements
- Unclear AI Ops Process & Roles

AIMS 5.0 - Improve applicability & sustainability of AI in manufacturing

- 53 partners in 12 countries
- Approved by BMWK in 01/2023
- Starting in spring 2023

Vision

- Ease use of AI tools & methods
- Increase production efficiency with AI
- Improve sustainability using AI

Optimizing semiconductor production using AI and scheduling to balance competing goals

1. Establish analytical process
→ **Process Analytics & Modeling**
2. Improve execution planning
→ **Scheduling & Dispatching**
3. Squeeze all the juice from the precious orange
→ **Enable AI on the shopfloor**
